SUMMARY

iOS Developer who builds and maintains production apps in Swift with UIKit and SwiftUI, with 5 apps live on the App Store across 7 client projects. Experienced in RESTful API integration, offline storage with Core Data and SwiftData, push notifications with Firebase Cloud Messaging, StoreKit 2 subscriptions, CoreBluetooth device integration, and multithreading with Swift Concurrency and GCD. Strong at finding and fixing memory leaks, retain cycles, and data races in existing codebases, and at building interfaces that follow Apple's Human Interface Guidelines.

SKILLS

iOS Frameworks: UIKit, SwiftUI, Combine, Core Data, SwiftData, Core Animation, Core Graphics, Core Image, CoreBluetooth, StoreKit 2, AVFoundation, MapKit, WidgetKit, UserNotifications

Languages and Architecture: Swift, SQL, Java; MVVM, Clean Architecture, Coordinator Pattern, Protocol-Oriented Programming, Dependency Injection, SOLID

Networking and Data: RESTful APIs, URLSession, Codable, JSON, Socket.IO, Pagination, Offline Storage, Caching, Keychain

Performance: Multithreading, Grand Central Dispatch (GCD), Swift Concurrency (async/await, actors), Memory Management, Performance Tuning, Debugging

Integrations: Push Notifications, Firebase Cloud Messaging (FCM), Firebase Authentication, Cloud Firestore, Realtime Database, Analytics, Apple Pay, Stripe, Sign in with Apple, Google Sign-In, Deep Linking, App Tracking Transparency, SKAdNetwork

Testing and Tools: XCTest, XCUITest, Swift Testing, Unit Testing, SwiftLint, Xcode, Git, GitHub, Bitbucket, Swift Package Manager, CocoaPods, TestFlight, App Store Connect

Practices: Apple Human Interface Guidelines, Localization (including right-to-left), Accessibility (Dynamic Type), Code Review, Agile

PROFESSIONAL EXPERIENCE

iOS Developer | MLBench | Lahore, Pakistan | Nov 2025 – Present
Deliver features, integrations, and fixes across 7 client iOS apps, 5 of them live on the App Store, working with back-end, design, and QA teams.

Fikar – Islamic Community Platform (App Store)

- Main iOS contributor (150 of 156 commits) on a 265-file SwiftUI and UIKit codebase; shipped releases through version 2.0 using TestFlight and App Store Connect.
- Built appointment booking with recurring availability scheduling and Apple Pay checkout, private Q&A with real-time chat and voice messages, polls, events, and leaderboards.
- Implemented push notifications with Firebase Cloud Messaging and deep links that open the exact screen for each notification type; wrote the payload contract adopted by the back-end team.
- Improved stability and memory use by fixing retain cycles, leaked AVPlayer and database observers, a data race in shared state, and a pagination race condition.
- Reduced network reads by replacing per-row live Firestore listeners with one-time fetches, and added offline support with SwiftData caching and network monitoring.
- Localized the app into English, Arabic (right-to-left), Urdu, and Bengali, and wrote 9 end-to-end XCUITest flows.
- Refactored duplicated pagination, empty-state, and rating code into reusable components and removed unused screens and services.

True Drop – Sobriety and Recovery App (App Store)

- Implemented monthly and yearly auto-renewable subscriptions with StoreKit 2, including product loading, verified transactions, upgrades, and transaction updates.
- Synced premium entitlements with RESTful back-end APIs at app launch, login, and account changes.
- Built daily check-ins, streak tracking with skipped-day handling, and animated milestone progress in SwiftUI with MVVM and Combine; introduced SwiftLint.

Sokar – Glucose Monitoring App

- Built the CoreBluetooth module for a glucose sensor: scanning, pairing, session management, command encoding, response parsing, and CRC-16 frame validation.
- Created a protocol-based mock Bluetooth manager to develop and test without hardware, plus diagnostic logging; added Arabic and English localization.

Belleria – Connected Device Companion App

- Sole iOS developer; built the app from scratch in SwiftUI with a feature-based structure and a light and dark design system.
- Wrote a reusable async/await networking layer as a Swift actor, with Keychain-stored device credentials and OSLog logging.
- Implemented Wi-Fi device discovery and setup, device registration, alerts, and real-time updates over Socket.IO.

Koy (App Store) and Lumashape (App Store)

- Koy: built state-driven radar pulse animations for nearby-user discovery; fixed push notification delivery, Firebase phone authentication, Sign in with Apple, and Google Sign-In.
- Lumashape: added input validation and upload of original and segmented images; fixed image orientation and measurement unit bugs.

iOS Developer | 3TechSoft | Rawalpindi, Pakistan | Jul 2025 – Oct 2025

Sketch Anime – Photo Editing App

- Built a photo-to-sketch feature with Core Image, SwiftUI, and UIKit using the Coordinator pattern inside an existing UIKit codebase.
- Improved image-processing responsiveness by moving work to background threads with cancellable tasks and reducing memory pressure during heavy operations.
- Built adaptive iPhone and iPad layouts, fixed popover, camera-permission, loading, and error-state issues, and integrated App Tracking Transparency and SKAdNetwork.

PROJECTS

FitTracker – Heart-Rate Workout Tracker | Swift 6, SwiftUI, Core Data, CoreBluetooth, Vapor

- Designed an offline-first app across 10 Swift Package modules using Clean Architecture, MVVM, and dependency injection; Core Data persistence on background contexts behind repository protocols.
- Wrote 97 automated tests with Swift Testing; built a Vapor back end with JWT authentication and PostgreSQL.

Movies Browser | UIKit, Core Data, REST API | github.com/Dawoodakbar/BroswersApp

- UICollectionView compositional layouts, UISearchController, paginated REST API results, Core Data offline favorites, and NSCache image caching.

EDUCATION

Bachelor of Science in Software Engineering | International Islamic University, Islamabad | Sep 2021 – Jun 2025

LANGUAGES

English (professional working proficiency), Urdu (native)
